

Audiogram of the Mouse Opossum (*Marmosa elegans*)

Data from: Frost, S.B., and Masterton, R.B. (1994) Hearing in primitive mammals: *Monodelphis domestica* and *Marmosa elegans*. *Hearing Research*, 76, 67-72.

Absolute thresholds (in dB re 20 $\mu\text{N}/\text{m}^2$) for two opossums (designated A and B)

Frequency (in kHz)	Individual Thresholds (in dB)		Average
	A	B	
1	96	—	96
2	88	—	88
4	62.5	48	55.5
8	37.5	39	38
16	43	47	45
32	31	35	33
64	38.5	40	39.5
75	48.5	52.5	50.5
85	75.5	82	78

Lowest and highest frequencies audible at sound pressure levels (SPL) ranging from 40 to 70 dB SPL

SPL (in dB)	Lowest audible frequency (in kHz)	Highest audible frequency (in kHz)
70	2.9	82
60	3.6	78
50	5.0	75
40	7.4	64
30	—	—

Additional Parameters:

Body weight = 50 g

Functional interaural distance = 60 μs

(Time required for sound to travel around the head from one auditory meatus to the other.)

Comments: Threshold values taken from graph in Frost & Masterton, 1994.
